

# MEAN STCK PHASE ONE CMS PROJECT

**Student Name: Suraj Shivanand Patil**

## Background of the problem statement:

As the project is progressing, management has asked you to create a blog page for the company website so that newsletters and other informative articles can be posted by experts for the benefit of the customers.

## Solution:

I develop a single page blog for it. Where users can add a new post on the blog.

## Single Post:

- Category
- Cover Image
- Title
- Description

The user must add the above data for publishing his/her post.

## Classification:

The post will classify according to the user's input (Category Dropdown). I will go to the specific section selected by the user.

## Navbar Mapping:

I mapped with a navbar with section by using [ href="#section-type"].

## Used Technology Stack:

- HTML5
- CSS library Bootstrap
- JavaScript library jQuery

## How to Use:

1. Download the folder from GIT
2. Open index.html
3. By Default I put 3 articles in each section.
4. For adding a new post click on + New Post
5. Fill the form
  - a. Category
  - b. Cover Image
  - c. Title
  - d. Description
1. And click on submit. You can see your post in the specific category section.
6. You can add the N number of posts.
